DESCRIPTION

The Model 1521 is a low-cost, general purpose integrated accelerometer for use in zero to medium frequency instrumentation applications that require extremely low noise and reliable long-term stability. Each miniature, hermetically sealed package combines a micro-machined capacitive sense element and a custom integrated circuit that includes a sense amplifier and differential output stage. It is relatively insensitive to temperature changes and gradients. Each device is marked with a serial number on its top and bottom surfaces for traceability. An optional calibration test sheet (1521-TST) is also available which lists the measured bias, scale factor, linearity, operating current and frequency response.

### MAXIMUM RATINGS *

- Case Operating Temperature $^2$ -55 to $+125^\circ C$
- Storage Temperature $^2$ -55 to $+125^\circ C$
- Voltage on $V_{DD}$ to GND -0.5V to 6.5V
- Voltage on Any Pin (except DV) to GND $^4$ -0.5V to $V_{DD}$+0.5V
- Voltage on DV to GND (Self-Test) ±15V
- Power Dissipation 50 mW

Note 1: Tighter tolerances may be available on special order.

**Note 2: Minimize exposure above 125°C for maximum lifespan.**

Note 3: For 2g thru 50g only; 100g and greater versions are tested and specified from -65 to +65g.

Note 4: Voltages on pins other than DV, GND or $V_{DD}$ may exceed 0.5 volt above or below the supply voltages provided the current is limited to 1 mA.

* NOTICE: Stresses greater than those listed above may cause permanent damage to the device. These are maximum stress ratings only. Functional operation of the device at or above these conditions is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability and lifespan.

### OPERATION

The model 1521 sensitive axis is perpendicular to the bottom of the package, with positive acceleration resulting from a positive force pushing on the bottom of the package. The seismic center is located on a centerline through the dual sense elements and halfway between them. The internal electronics effectively cancel any errors due to rotation. Two reference voltages, +5.0 and +2.5 volts (nominal), are required; scale factor is ratiometric to the +5.0 volt reference voltage relative to GND, and both outputs at zero acceleration are nominally 80 mV below the +2.5 volt input.

The Model 1521 produces a differential +/-4 volts output voltage or single ended mode, 0.5 – 4.5 volts full scale, the value of which varies with acceleration as shown in the figures below.
**SIGNAL DESCRIPTIONS**

**V<sub>DD</sub> and GND (power):** Pins (14) and (19) respectively. Power (+5 Volts DC) and ground.

**AOP and AON (output):** Pins 12 and 16 respectively. Analog output voltages proportional to acceleration. The AOP voltage increases (AON decreases) with positive acceleration; at zero acceleration both outputs are nominally equal to the +2.5 volt reference. The device experiences positive (+1g) acceleration with its lid facing up in the earth’s gravitational field. Use of differential mode is strongly recommended for both lowest noise and highest accuracy operation. Voltages can be measured ratio-metrically to VR for good repeatability without requiring a separate precision reference voltage for an A/D.

**DV (input):** Pin 4. Deflection Voltage. A test input that applies an electrostatic force to the sense element, simulating a positive acceleration. The nominal voltage at this pin is ½ V<sub>DD</sub>. DV voltages higher than required to bring the output to positive full scale may cause device damage.

**VR (input):** Pin 3. Voltage Reference. Tie to a good reference (not directly to VDD) for best scale factor repeatability. A 0.1μF bypass capacitor is recommended at this pin. VR current is less than 100 µA.

**2.5 Volt (input):** Pin 17. Sets internal and output common mode value. Tie to a resistive voltage divider from +5 volts. A 0.1μF bypass capacitor is recommended at this pin.

**I<sub>T</sub> (output):** Pin 8. Temperature dependent current source. May be tied to V<sub>DD</sub> if not used.

**Special Use Pins:** Pins 9 and 11 should be tied to VDD, Pins 2, 5, 6, and 18 to GND.

**** Pins 1, 7, 10, 13, 15, and 20 are reserved for future use and should remain unused **

**RECOMMENDED CONNECTIONS**

**DEFLECTION VOLTAGE (DV) TEST INPUT:** This test input applies an electrostatic force to the sense element, simulating a positive acceleration. It has a nominal input impedance of 32 kΩ and a nominal open circuit voltage of ½ V<sub>DD</sub>. For best accuracy during normal operation, this input should be left unconnected or connected to a voltage source equal to ½ of the V<sub>DD</sub> supply. The change in differential output voltage (AOP - AON) is proportional to the square of the difference between the voltage applied to the DV input (V<sub>DV</sub>) and ½ V<sub>DD</sub>. Only positive shifts in the output voltage may be generated by applying voltage to the DV input. When voltage is applied to the DV input, it should be applied gradually. The application of DV voltages greater than required to bring the output to positive full scale may cause device damage. The proportionality constant (k) varies for each device and is not characterized.

\[ \Delta(AOP - AON) = k \left( V_{DV} - \frac{1}{2} V_{DD} \right)^2 \]

The 2.5V input (pin 17) may be driven from a resistive divider.
**Model 1521 Analog Surface Mount Accelerometer**

**ESD and LATCH-UP CONSIDERATIONS:** The model 1521 accelerometer is a CMOS device subject to damage from large electrostatic discharges. Diode protection is provided on the inputs and outputs, and it is not easily damaged, but care should be exercised during handling. However, individuals and tools should be grounded before coming in contact with the device. Although the 1521 is resistant to latch-up, inserting a 1521 into or removing it from a powered socket may cause damage.

**INTERNAL TEMPERATURE SENSING**

The model 1521 accelerometer contains a temperature dependent current source that is output on pin 8. This signal is useful for measuring the internal temperature of the accelerometer so that any previously characterized bias and scale factor temperature dependence, for a particular accelerometer, can be corrected. The nominal output current at 25°C is \( \approx 500 \pm 200 \) μA and the nominal sensitivity is \( 1.5 \pm 0.5 \) μA/°C. Fluctuations in \( V_{DD} \) & \( V_{R} \) have little effect on the temperature reading. A reduction of 0.10 V to both \( V_{DD} \) & \( V_{R} \) will reduce the current about 1 μA, which corresponds to less than a 1°C change in reading. With a single resistor \( R_T = 2K \) between \( I_T \) (pin 8) and GND the output voltage \( V_T \) will vary between +0.76 and +1.3 volts from -55 to +125°C, which equates to a sensitivity of \( \approx +3 \) mV/°C.

\[
V_T = R_T \left[ (500 \mu A) + [(1.5 \mu A)(T - 25)] \right] \quad \frac{\Delta V_L}{\Delta T} = R_T (1.5 \mu A)
\]

If a greater voltage change versus temperature or lower signal source impedance is needed, add the amplifier as shown on the right side in Figure 2. With offset voltage \( V_{OFF} = -5V \), gain resistor \( R_g = 15.0K \) and offset resistor \( R_{OFF} = 7.32K \), the output voltage \( V_T \) will vary between +4.5 and +0.5 Volts from -55 to +125°C, which equates to a sensitivity of \( \approx -29 \) mV/°C.

\[
V_T = -R_g \left[ \frac{V_{OFF}}{R_{OFF}} + (500 \mu A) + [(1.5 \mu A)(T - 25)] \right] \\
R_{OFF} = \frac{-V_{OFF}}{\left( \frac{V_T}{R_g} \right) + (500 \mu A) + [(1.5 \mu A)(T - 25)]} \\
\frac{\Delta V}{\Delta T} = -R_g (1.5 \mu A) \quad R_g = \frac{-\Delta V_T}{(1.5 \mu A)(\Delta T)}
\]

Figure 3 shows the voltage compliance of the temperature dependent current source \( I_T \) at room temperature. The voltage at pin 8 must be kept in the 0 to +3V range in order to achieve proper temperature readings.
PACKAGE DIMENSIONS

1. *Dimensions “M,” “T,” and “U” locate sensing element’s center of mass.
2. Lid is electrically tied to terminal 19 (GND).
4. Terminals are plated with 60 microinches min gold over 80 microinches min nickel. This plating specification does not apply to the Pin-1 identifier mark on the bottom of the J-lead package version.
5. Package: 90% min alumina (black), lid: solder sealed kovar.

SOLDERING RECOMMENDATIONS

RoHS Compliance: The model 1521 does not contain elemental lead and is RoHS compliant.

Pre-Tinning of Accelerometer Leads is Recommended: To prevent gold migration embrittlement of the solder joints, it is best to pre-tin the accelerometer leads.

LCC Solder Contact Plating Information: The plating composition and thickness for the solder pads and castellations on the “L” suffix (LCC) package are 60 to 225 micro-inches thick of gold (Au) over 80 to 350 micro-inches thick of nickel (Ni) over a minimum of 5 micro-inches thick of moly-manganese or tungsten refractory material. The J-Lead package top layer is 100 to 225 microinches thick of 99.7% gold (Au) over 80 to 350 microinches thick of electroplated nickel (Ni).

Do not use ultrasonic cleaners.

Ultrasonic cleaning will void the warranty and may break internal wire bonds.
